Table 1. Number of sites surveyed and photographs of the golden cats recorded during the two seasons. I computed naïve occupancy as the number of sites where the golden cats were recorded divided by the total number of sites surveyed in a given season. [a] Naïve occupancy is a surrogate of species abundance (Rovero and Fridolin 2016; Rovero and Marshall 2009). [b] Independent events are detections taken one hour or longer apart.

Season	Number of sites surveyed	Number of sites with golden cats	[a] Golden cat naïve occupancy	Total number of golden cat photographs	[b] Golden cat independent events
Dry	62	20	0.32	291	40
Wet	35	22	0.63	574	95
